Source Four LED Fresnel Adapter

The Source Four LED has a flat field, which should be taken into account when calculating foot-candles.

Below is a comparison between two fixtures that produce similar amounts of light, but different light distributions.

The D40 has a much narrower beam, so the fixture will seem much brighter in the center. The Source Four LED, on the other hand, distributes light more evenly, and brightness will be similar across the beam.

Throw Distance Multiplier (TDM)

To determine the distance from the center of the beam (Origin) to a certain illuminance level at a particular distance, multiply the desired throw distance by the TDM desired on the Iso-Illuminance diagram.

Throw Distance (TD) x Throw Distance Multiplier (TDM) = Distance from the Origin (DfO) (distance from the center of the beam)

Example: 25 feet (TD) x 0.047 (TDM) = 1.175 feet from center of beam (DfO)
